

SNOMED CT Content Development – A Country Perspective

Agenda

- About Canada Health Infloway
- Request For Change (RFC) Metrics
- Challenges with processing RFCs
- Infloway's RFC tool
- Workflow model
- Consultations with experts
- Suggested future directions

Canada Health Infoway

- Created in 2001
- \$2.1 billion in federal funding
- Independent, not-for-profit corporation
- Accountable to 14 federal/provincial/territorial governments

Mission:

Fostering and accelerating the development and adoption of electronic health information systems with compatible standards and communications technologies on a pan-Canadian basis with tangible benefits to Canadians. *Infoway* will build on existing initiatives and pursue collaborative relationships in pursuit of its mission.

Infoway's vision

- **Healthier Canadians through innovative e-health solutions.**

SNOMED CT Content Development Projects

- Microorganism content
 - A provincial initiative in collaboration with Infoway to use SNOMED CT for the reporting of lab results, to use the potentials of SNOMED CT and to reduce the local maintenance burden
 - ~ 1800 RFCs
- DI content
 - This project developed a SNOMED CT common DI terminology to support the implementation of DI Common Services for all of Ontario.
 - ~ 900 RFCs
- Vaccine content
 - A provincial initiative in collaboration with Infoway that lead to the development of 7 SNOMED CT refsets to support immunization functionality. The subsets enable the consistent capture of immunization data using standardized terminology
 - ~ 300 RFCs
- Overall, ~4000 RFCs in the past 2 years

Challenges with processing RFCs

- Volume
- Required turnaround time
 - E.g. approximately 45 mins/RFC was needed on average
- Tooling
 - Up to this summer no tooling solution beyond Excel was available
 - Lots of manual work
 - Prone to error
- Modeling challenges
 - Uncertainties in international direction

Introduction to InfoRMS

- Infoway Request Management System
- Replaced the previous RFC Process for SNOMED CT with a more efficient and streamlined process
- Scalable – supports multiple projects (HL7, pCLOCD)
- Supports integration in the end-to-end terminology solution

Benefits

- Reduction in errors (stronger data validation, checks for missing information, no reliance on copy-and-paste)
- Better tracking of the requests in a centralized database
- Better communication provided by the tool (manual email communication is no longer required)
- Increased productivity
- Reduced turnaround time for requests from Canadian implementers

Implementation project

- Project planning phase began in November, 2012
- Agile implementation – four sprints and a stabilization phase
- Operational since July 2013

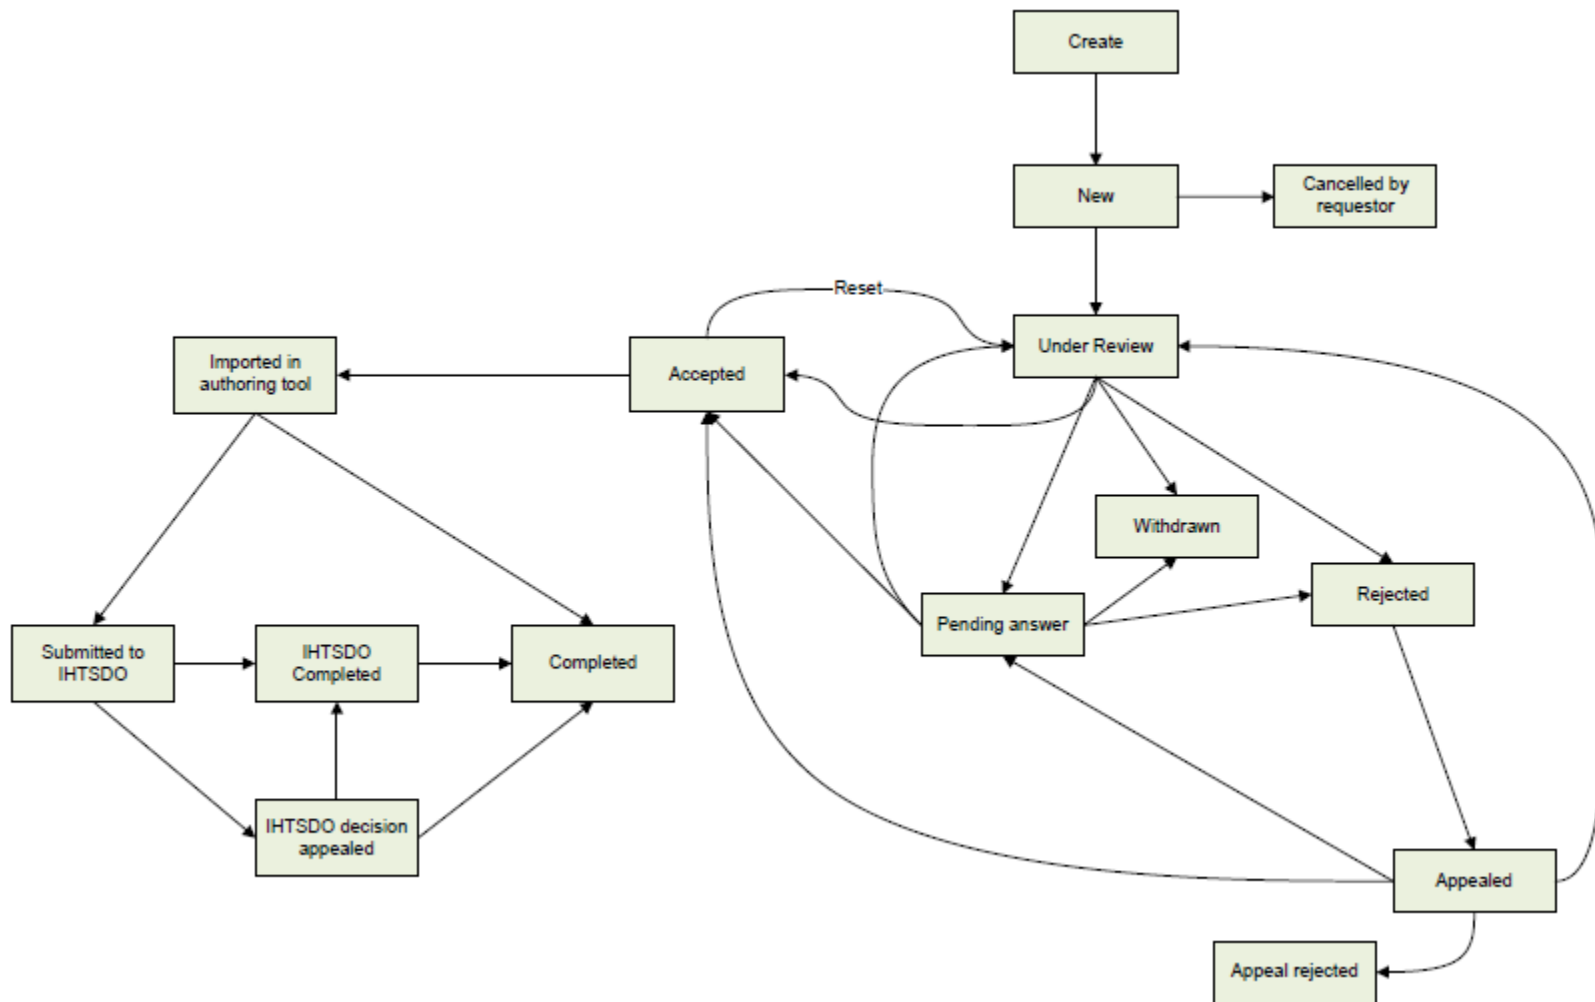

JIRA-based tool

- JIRA is a commercial change/issue tracking system developed by Atlassian
- One of the best solutions for tracking changes in the world, adopted by high-profile companies (BMW, Facebook, Cisco, Nike, eBay, etc.)
- Highly customizable (request types, fields, workflow, etc.)
- Plugin-based architecture allows extending the functionality through:
 - Installation of third-party plugins
 - In-house development of custom plugins
- Allows hosting multiple “projects” with distinct actors and access controls;

Before - After

Before	After
<ul style="list-style-type: none">• Requestor downloads the template from InfoCentral• Requestor completes the template and emails to SC• Communication between SC and requestors done through different methods (emails, phone calls, etc.)• No easy way to document all communication• No way for requestors to know the status of their requests other than asking SC• Log of previous requests out of date	<ul style="list-style-type: none">• Requestor downloads the template from the tool• Requestor completes the template and uploads via the tool• All communication done within the tool and stored in the tool• Requestors can not only see the status of their requests but they can also monitor other requests that are of interest to them• All requests are up to date in the tool

Integrated workflow

- Adding a new RFC
- RFCs can be entered individually or in a batch
- RFCs can be of 6 types as shown in the picture

Create Issue

Project*

Issue Type* ?

Proposed FSN*

Proposed Semantic Tag*

Proposed PT*

The PT (Preferred Term) that you propose for this concept

Proposed Synonym 1

A synonym that you propose for this concept

Proposed Synonym 2

A second synonym that you propose for this concept ?

Proposed Parent ID

The concept ID of the parent that you are proposing for this concept ?

Proposed Parent FSN

The concept FSN of the parent that you are proposing for this concept ?

Definition of Proposed Concept

A text definition for the new concept ?

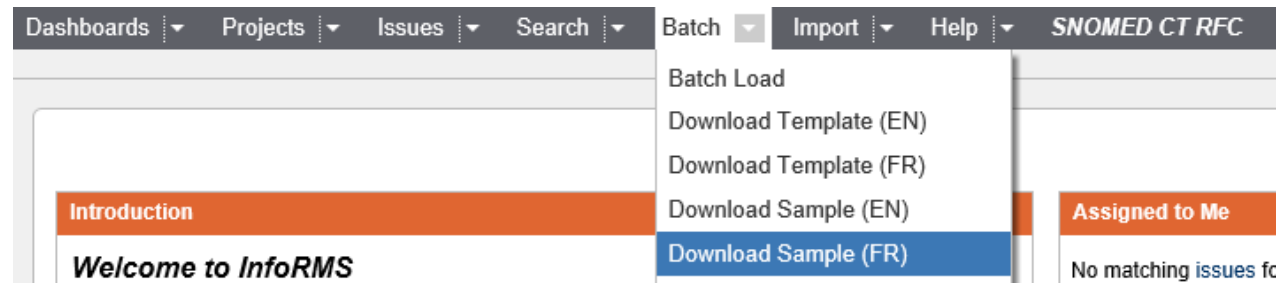

Source Terminology Version

Version of SNOMED CT that you checked and does not include the requested concept. Format: Year Month, e.g. 2013 January

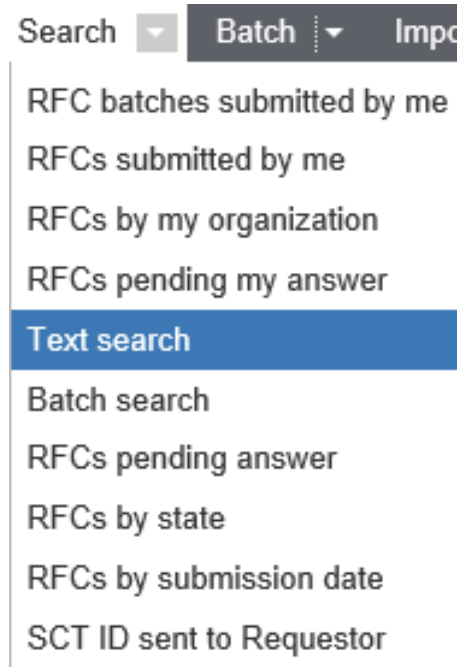

Reason for Change

Create another

- A “batch” template can be downloaded in English or French
- The template is an Excel file that needs to be completed and uploaded

- Search options
- Several search options are developed
- More search criteria can be entered by users; JIRA supports SQL

- Workflow options within the tool support transitioning the request between states

SNOMED CT RFC / SCT-1920 1 of 4363 [Return to search](#)

Coagulase Negative Staphylococcus/Micrococcus (finding)

Dates

Consultations with experts

- Several consultations were made on issues such as:
 - Validity of RFCs
 - Modeling issues
 - Naming issues
- Consultations were done with:
 - Internal resources
 - Canadian experts (e.g. Winnipeg public health lab)
 - International experts (e.g. Jim Case)
 - IHTSDO (e.g. Chief Terminologist)
 - CAP
 - IHTSDO content project were reviewed

Communication with requestors

- Close communication was maintained with the requestors
- Experts at the requesting organizations were involved to ensure the intent of the RFCs are clear and to agree upon a solution
- Name changes were proposed and discussed
- RFCs were generally not rejected without involvement and understanding of the requestor

Uncertainties at the international level

- Some content projects at the IHTSDO make modeling/naming guidelines a moving target
- When consultation channels were exhausted we had to make decisions

Example of approach taken - Micro

- **RFC pattern:**

- X species (organism). For example: Shigella species (organism)

- **Problems:**

- They fall under Genus and become siblings to other species of the same Genus
- It is like a catch-all concept, or similar to 'unknown', 'not otherwise classified', etc. that classification systems have and a terminology such as SNOMED would not allow
- What it really means is that the lab has found an organism and is down to the level of Genus but is not sure which species it belongs to

- **Consultation:**

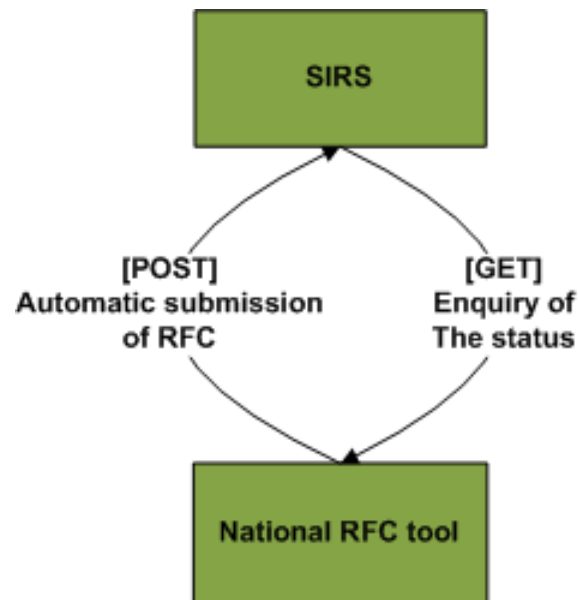

- Consulted with Kent Spackman and James Case.

- **Solution:**

- Create these as "observation result" instead of organism. Since observation result has not been added as a semantic tag yet, we are creating them as finding for now. The created concepts are "X species unspecified (finding)"

Suggestions

- Integration between SIRS and national RFC tools should be considered
 - E.g. through APIs

Suggestions (2)

- Decisions and context leading up to decisions should be transparent and accessible to NRCs working on Content Development
- Consultations with experts have been a very successful approach
 - It would be great if there was a cross-NRC/IHTSDO sharing of expertise and decision
 - Working in isolation is not a good practice
 - Involving stakeholders ensures
 - Efforts are not duplicated
 - A consistent international approach is taken
 - Others can benefit from the same work
- Tighter communications with requestors makes the process more transparent and more satisfactory at the end
