

13.1 How to create a new Reference Set using an existing pattern

In order to create a new [Reference Set](#), you will need access to a [namespace](#) in order to generate SCTIDs. Within your [namespace](#), you should add one [module|d concept](#) (with an FSN and [Preferred Term](#)), under the [Module] sub - [hierarchy](#) within the metadata, for each of your authoring organizations .

Then, follow the steps below to create a new [reference set](#):

- [13.1.1 Define the Reference Set in the metadata hierarchy](#)
- [13.1.2 Define the Reference Set Attributes within the metadata hierarchy](#)
- [13.1.3 Create the Descriptor for the Reference Set](#)
- [13.1.4 Add members to the Reference Set](#)

CAUTION:

All [components](#) created during these processes must have unique [Identifiers](#) and all those [Identifier](#) must be allocated in the correct partition of your organizations namespace. For details see [SNOMED CT Identifiers](#) .
