id (field)

A field that provides the unique identifier of a component (concept, description or relationship) or reference set member.

Note:

- The data type of the id for a component is SCTID and this identifier is used to refer to the component.
- The data type of the id for a reference set member is UUID. This identifier is only used to support versioning of rows (member) in a Reference set; it does not identify the Reference set itself (see refsetId) nor does it identify to a component referred to by the Reference set (see referencedComponentId).
