postcoordinated expression

An expression that contains two or more concept identifiers to represent an idea.

Notes

- The concept identifiers in a postcoordinated expression relate to one another in ways that build more specific clinical ideas. The required meaning is expressed by postcoordinating several clinical ideas, each of which is represented by an identified concept.

Example

- The concept 125605004 fracture of bone can be refined using the attribute 363698007 finding site, and the body structure concept 71341001 bone structure of femur, to create the following postcoordinated expression:

```
```

Alternatives

- Postcoordinated
- Postcoordination
