5.5. Display Navigation Results Effectively

Results navigation is a useful feature for search browsers to have in addition to the conventional display of search results (see 5.1. Order Search Results Rationally and 5.4. Rationalize Search Results by Subsumption Checking). The decision to design navigation results in a browser may depend on space availability in the application’s user interface. This sub-section describes two different types of hierarchies for browsing search results.

- 5.5.1. Using the Subtype Hierarchy
- 5.5.2. The Challenge of Subtype Navigation
- 5.5.3. Using the Navigation Hierarchy
