2017-09-28 Editorial Advisory Group Conference call

Zoom Meeting Details
SNOMED Int'l Editorial Advisory group
SNOMED International - Editorial advisory group conference call
UTC
Please join my meeting from your computer, tablet or smartphone.
https://snomed.zoom.us/j/874963309

Attendees
Chair:
• Jim Case
AG Members
• Keith Campbell (AM)
• Guillermo Reynoso
• Bruce Goldberg
• Paul Amos

Observers:
Toni Morrison
Penni Hernandez

Apologies

Meeting Files
Sepsis models.pptx
2017 KDIGO Update

Objectives
• Obtain consensus on agenda items

Discussion items

4 Procedure with clinical focus vs. Procedure for indication JCA

This was initiated from a request for “Reduction of soft tissue for auricular prosthesis”. There is currently the concept 410771003. Surgical procedure for clinical finding and/or disorder (procedure), which has 156 direct descendants. The use of the HAS FOCUS attribute allows for the reason for the procedure to be modeled. A recent set of diagnostic imaging procedures that included the reason the procedure was being done resulted in an editorial decision to disable the future addition of precoordinated reasons for procedure. Recent discussions with editors have questioned whether this is necessary given the slate of requests for this type of concept.

Concerns from the HoT include:
1) the potential high number of precoordinated terms that would be created if every reason for a procedure were allowed;
2) the reason for a procedure should be captured as a separate clinical finding to document that the “diagnosis” has been established. Precoordinating the reason precludes the need for separately documenting that the condition exists in the patient;
3) some reasons provided for procedures may be so vague as to provide little additional information. (e.g. Radiography of upper limb for musculoskeletal disorder).

KCA: Opinion is that we should not add the reason for the procedure to the pre-coordinated and leverage the supporting information model to capture the relationships (e.g. CMI, FHR). The reasons for procedure may change requiring a lot of maintenance.

GRE: Agrees that combining indication with procedure should be captured elsewhere. Generally you do not add to a procedure things that do not change the way the procedure is performed. E.g. “Skin prep for X”

A potential exception is when the reason changes the nature of the procedure. E.g. reduction of shoulder dislocation (based on the way the reduction is performed). Should not contaminate the terminology with things that should go into the information model. There has been some overloading of HAS FOCUS and should be reviewed.

BGS: In the KP model, need to have the procedure and the reason for procedure for billing. This is sometimes difficult to capture. But in general, agrees with no pre-coordinating.

PAM: Agrees the pre-coordination should not be allowed, but relying on the information model may not be universally acceptable.

Post-coordination on how to represent these should be provided to users to encourage them to leverage this type of concept.

5 "Primary" procedures JCA

Primary procedures – what is the use case for calling out a procedure as “primary” when we have the "unspecified" procedure? https://jira.ihtsdotools.org/browse/PCP-81 (currently closed as pattern not allowed). The current block to addition of these types of terms was challenged by the UK.

Discussion points:
- A primary procedure can only be performed once. All other procedures of the same type for the same condition at the same site can be considered a revision.
- A revision procedure is not performed the same way as the original procedure as the site and the condition have been altered due to the primary procedure.
- There are existing concepts that differentiate a “complete” procedure from a partial procedure or revision.
- While the existing procedure terms are not explicit about their “primary” nature, it is implied that when a procedure concept is used, it represents the first time that this procedure has been performed at this site for this condition.
- The lack of an explicit revision status (anything other than the initial procedure) implies its primary nature.

For these reasons, the addition of “primary” procedures either makes existing procedures ambiguous (they can mean procedures with any revision status), or they become abstract grouper concepts, that should not be used in clinical records, or they represent two ways to represent “primary” procedures.

Clarifying question: Is the use of the term “primary” in procedures an administrative designation?

ANCILLARY QUESTION: There are currently 415 "Primary X (procedures)" concepts. If this pattern were disallowed, what would we do with the existing content? There are a number of concepts of this type that serve as anestors for concepts related to the first stage of a multi-stage surgical regime.

KCA: Do we have a reproducible meaning for "primary" that does not drift over time?

GRE: We cannot determine that a procedure is primary or not unless we know that a prior procedure has been done in the past. The knowledge of what is primary or not is dependent on the prior condition of the patient (revision or not). There are a number of multi step procedures, but would each step of these procedures be primary as well?

This similar to “recent” conditions that is a vague notion that is not universally understood. It would be defined in the context of the entire record. There may be some exceptions, but the existing terms can be reviewed for inactivation. Only when a procedure is defined by a revision can this content be allowed.

BGS: Agrees with not creating additional primary procedures. The unspecified procedure should be interpreted as “primary”.

PAM: The UK extension has about 1500 “primary” procedures. The domain where this is needed is plastic surgeons and is needed for quality reporting. Agrees with the prior discussion, but there may be exceptions for specialist surgeons where primary might have a specific meaning.

GRE: You should not have a primary procedure if you do not have a revision. So if a procedure only has one subtree of “primary” then they are semantically equivalent.

PAM: Would like more input from the royal college on why this terminology was recommended.

6 “Apps” as devices JCA/IGR

A question related to the SI position on the classification of “Apps” as devices. ISO has recently developed guidance on this, stating that computer programs/Apps are for all intents and purposes medical devices if used for medical purposes.

What should be the SI position on this? Modeling impacts?

KCA: Si should not take a position on whether it is a device or not, but assure safety of applications that use SNOMED. There is not a universal definition as to whether apps are devices or not.

PAM: Provided an example of where a software failure caused patient safety issues. Extended discussion on the evolution of apps as commodities in personal health and the future developments.

Jim Case: Provide example of post coordinaton on way to represent this type of content for the SI guid.
### ECE Update

**BOO**

- Sepsis/Sepsis-associated organ dysfunction.

  The third International Consensus Definitions for Sepsis and Septic Shock (Sepsis-3) published in 2016 state sepsis is a multi organ dysfunction syndrome due to an infection or more specifically due to an dysregulated host response to infection. Current model places sepsis as a subtype of SIRS and infectious disease which is not consistent with Sepsis-3 definition. Proposed model: IsA Multiple organ dysfunction syndrome due to infection.

- Would a new pathological process of dysregulated host response be required in order to fully define sepsis?

### Findings related to skin wounds

**JCA**

A number of requests related to findings related to surgical skin wounds and pressure injury findings reveal an issue with current structure. Most of the requested terms are Findings related to skin wounds, but currently 262526004 |Wound of skin (disorder)| is a disorder, so cannot be used as a parent for findings related to skin wounds. There is currently 225552003 |Wound finding (finding)|, but it is not specific to skin. 262526004 |Wound of skin (disorder)| currently has 65 immediate subtypes, many of which could reasonably be viewed as findings (e.g. “Abrasion of X”).

Need to make a determination of whether observations related to wounds (i.e. color, discharge, odor) should be placed in a subhierarchy different from the “Wound (disorder)” itself.

### Specimen from subjects other than the patient

**JCA**

Currently we have many concepts in the specimen hierarchy that include “from patient” as well as those that do not include it as an ancestor. Since the subject of record is the default for specimens, we would like to retire these apparent duplicates, but then we run into the problem of specimens derived from other sources such as donors or normal control patients.

They cannot be subtypes if the intended meaning is “subject of record”, or can they, since the context is implied? How do we structure the specimen hierarchy to account for this?

What are the analytical implications of having different sources for specimens as subtypes of one another?

### Use of the Oxford comma in FSNs

**JCA**

The Oxford comma is a comma added after the penultimate term in a list, e.g. For example “Disorder of head, neck, and shoulders”. The purpose if its use is to make explicit the fact that the terms are part of a list. The editorial guide is silent about its use, but the example provided does not use the Oxford comma.

There are currently 347 FSNs in SNOMED CT that use the Oxford comma. Most of these are terms obtained from other terminology, such as ICD and nursing. There are 2590 FSNs that contain comma delimited lists, but do not use the Oxford comma.

Should SNOMED CT be consistent in the use of this grammar mark or maintain fidelity to the original source of the terms that do use it?

### Future meetings

**JCA**

SNOMED International Business Meeting - Bratislava, Slovakia. Full day meeting Tuesday October 17.

Meeting adjourned at 10:35 PDT
