

Setting up and operating a FHIR terminology service

A number of nations and organisations have FHIR based terminology services as implementation services for SNOMED CT and other terminologies and code systems. For example Canada have the [Terminology Gateway](#) and Australia have the [NCTS](#) which serve similar purposes.

The purpose of this page is to start a registry of these efforts and a place where experiences and approaches can be shared, and hopefully commonality can be achieved where fitting via collaboration.

Please share other similar efforts, point out areas of potential collaboration/standardisation, and of course any questions.

A list of the group's own servers along with the features supported by each can be found here: [Features of Known Servers](#)
